

Due: Friday, 13 March 2009

Collaboration: If you collaborated with someone during lab to create a program, please acknowledge that person by adding their name to the individual program file. This is especially important if you worked with different people on different days

Submission: Turn in a printed copy of your work at the beginning of class.

1. Submit program `swap.py` from Python Lab (Wed 2/25), Exercise 3 part 10. As described there, the program should begin with the lines

```
color1 = "red"
color2 = "blue"
```

It should then swap the values in the variables `color1` and `color2`, using only assignment statements. It should then print out the values in `color1` and `color2` with the line

```
print color1, color2
```

The output from your program should be: `blue red`.

2. Submit program `imagesize.py` from the Python: Numbers lab (Fri 2/25). This program was started in Exercise 2 part c, and improved in Exercise 3 part c. You should turn in the 3(c) version

As described there, the program should ask the user to enter the width and height of an image, and then compute and print: (1) the number of bytes required to store the image (assuming each pixel requires 4 bytes) and (2) the number of kilobytes required to store the image.

3. Submit program `favorite.py` from the Python: Conditionals and Repeition lab (Wed 3/4). This program was started in Exercise 1(b) and continued in 1(d).

As described there, the program should prompt the user to enter a color name. Your program should print one message if the color entered is your favorite color, and a different message otherwise. Your program should also print a final (relevant) message for every user.

4. Submit program `blastoff.py` from the Python: Conditionals and Repeition lab (Wed 3/4). As described there, your program should use a loop to produce output that counts from 10 down to 1 and then prints `Blastoff!`
